Case Study:  
UK National Health Service NPfIT Uses ebXML Messaging  

Date: 6 December 2004

Abstract:
The UK’s National Programme for Information Technology (NPfIT) is the world’s largest civil IT project. A central component of the NHS Care Records Service is the Transactional Messaging Service (TMS) Spine using the ebXML Messaging Service OASIS Standard and is likely to become one of the largest applications of this technical specification.

All background information provided in this case study is derived from the following public NHS documents:

- Introducing .. The National Programme for Information Technology
- NHS Care Records Service
- NHS National Spine

1 Executive Overview

1.1 Business Need

Better information leading to better health and care for every patient is at the heart of the National Health Service's National Programme for IT (NPfIT) in the United Kingdom. The NPfIT is about transforming the way information flows around the health service, making it possible to deliver faster, safer and more convenient patient care. In time it will give patients the information they need to look after their own health.

1.2 Project Description

The UK's National Health Service (NHS) is deploying IT systems and services that will link up to health care professionals to improve sharing of patients' records with those health professionals involved in the care of the patient across the NHS. It will eventually allow patients to look at their own health records from home using a protected link into the NHS. Health care records, appointment details, prescription information, and up-to-date research into illnesses and treatment will eventually be accessible to patients and health professionals whenever they need it to make health or care decisions.

Patient records will be stored electronically and be available to those authorised to see them. Access controls will be strict, and people will have different views of the record based on their role in the patient's care.

In the past, much essential patient information was written down and filed away. In recent years some information has been kept on computers in an individual NHS organisation but has only been accessible to NHS staff working in that organisation. The NHS Care Records Service will securely store patient information and be available to the right people when it is needed. It will even be possible to see images of the patient's X-rays and scans.

There are other benefits as well. Using new electronic booking services (Choose and Book), patients will be able to book initial hospital appointments from the GP surgery at a time and place of their choice. Prescriptions may also be sent electronically from the GP to a local chemist.
The NHS Care Records Service (NHS CRS) is central to NHS reform and will transform the way health and social care information is managed. It aims to give health and care professionals access to patient information where and when it is needed. It also aims to meet the needs of patients and to give them access to their own private health records.

Currently, health information is held as a mixture of paper-based and computer records that can't easily be shared. Even records held electronically are effectively 'locked away' on computers that can't talk to one another. The NHS Care Records Service plans to change this by setting up a system that allows information to be shared safely across the NHS. For the first time ever there will be a central summary record of a patient's care.

An individual is likely to be treated by a variety of care professionals in a range of locations throughout their life. The NHS Care Record is a means of ensuring that a summary of details of the care and treatment are held in a single, easily accessible, electronic record. The record will store an individual's essential personal details like their address, date of birth and NHS number. Eventually, it will show their health and care history. It will include information, such as whether a patient is diabetic or has a drug allergy, as well as details of the treatment and care they have received, building up a comprehensive patient history. It will also hold a summary of a patient's contact with all care providers and will record the patient's consent for care professionals to view their NHS Care Record.

Patient-centred care requires information to follow the patient so that it is available wherever and whenever it is needed. The NHS CRS is designed to allow this to happen. The National Programme for IT has awarded the national contract for NHS CRS to BT, which will provide software and support to connect all NHS organisations (including GPs, acute trusts and community and mental health trusts) in a single secure system. Local IT systems and support services will be provided by a Local Service Provider (LSP) in each of the five clusters of strategic health authorities.
The NHS Care Records Service will hold a summary record at a national level; more detailed information about all of a patient's contacts with the NHS will be held at the local level, where most health care is administered. The key nationally available information, together with the more detailed local information, combine to produce the complete Care Record of a patient.

2 Participants

British Telecom is a member of OASIS and has actively supported the development of the ebXML specifications. The chair of the OASIS ebXML Messaging Technical Committee is a British Telecom employee. Other British Telecom employees have contributed to other technical work within OASIS.

BT provides consultancy and systems integration services including business consultancy, complex program management, and custom systems design, development and operation. Within the NHS Care Records Service, BT is responsible for delivery, enhancement and long-term support for several key components of the Spine, including the Transaction and Messaging Service (TMS).

3 OASIS Standard or Specifications Used

The ebXML Messaging Service specification has been developed within the framework of OASIS, the not-for-profit, global consortium that drives the development, convergence, and adoption of e-business standards. Members themselves set the OASIS technical agenda, using a lightweight, open process expressly designed to promote industry consensus and unite disparate efforts. OASIS produces worldwide standards for Web services, security, conformance, business transactions, and interoperability within and between marketplaces. Founded in 1993, OASIS has more than 4,000 participants representing over 600 organizations and individual members in 100 countries.

The ebXML Messaging Service is an approved OASIS Standard that enables secure and reliable exchange of business documents between or within organizations. It is a modular part of a suite of specifications that is designed to support advanced integration requirements, whether in a private sector (e-business) or public sector (e-health, e-government) context.
Along with three other components of the ebXML framework, the ebXML Messaging Service was approved by the International Standards Organisation as ISO/TS 15000-2 in March 2004.

OASIS hosts the ebXML Web site, http://www.ebxml.org/, which serves as the international repository for ebXML-related information, such as case studies, implementations, ongoing developments, and other information. The OASIS ebXML Messaging Technical Committee was originally formed in 2001 and is currently working on the third version of the ebXML Messaging Service specification.

4 Technical Description

The Transaction and Messaging Service provides the communications infrastructure for the National Programme. It serves to interconnect regional network clusters managed by Local Service Providers (LSPs) and national services such as systems for electronic booking and transmission of prescriptions. The technology framework used for TMS is based on a large number of advanced technical specifications and standards. This includes the ebXML Messaging Service OASIS Standard, as well as the Security Assertion Markup Language (SAML) OASIS Standard and other Web services specifications.

Within the TMSSpine, ebXML is used to provide reliable messaging functionality. National services such as the Electronic Booking Service (Choose and Book) and Electronic Transmission of Prescriptions are accessed using pairs of XML request and response documents. These documents are transported within the NHS network as ebXML messages.

5 Benefits and Challenges

With an anticipated yearly volume of over 5,000,000,000 message by 2010, TMS is likely to be among the largest messaging systems in production in the world. For this very reason, TMS is also likely to be among the larger systems worldwide that will use the ebXML Messaging OASIS Standard.
6 Future Plans

The first service to become available is electronic booking of appointments. Called Choose and Book, it is beginning this summer in a few GP surgeries in London and Yorkshire. Over the next few years it will become available in surgeries across England. The new services are being introduced gradually, but by 2010, it is foreseen that the NHS Care Record and electronic prescriptions will be fully up and running.
Appendix A. Notices

OASIS takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on OASIS's procedures with respect to rights in OASIS specifications can be found at the OASIS website. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementors or users of this specification, can be obtained from OASIS.

OASIS invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary rights which may cover technology that may be required to implement this specification. Please address the information to the OASIS Executive Director.
