94 4 Introduction

95 4.1 Summary

96 The primary goal of the ebXML effort is to facilitate the integration of e-businesses throughout the
97 world with each other. Towards this end much of the work in ebXML has focused on the notion of a
98 public process: the business process(es) by which external entities interact with an e-business.
99 The specification and integration to such public processes has long been recognized as a
100 significant cost to such businesses. In order to reduce this cost ebXML is recommending the use of
101 Business Libraries. The principle goals of these libraries are to:

- 102 a) Promote reuse of common business processes and objects
- 103 b) Provide a place where companies and standards bodies could place the specifications of
104 their public processes where appropriate trading partners could access them.

105 In order to realize these goals, a *lingua franca* needed to be leveraged so that all users of this
106 repository could understand what each other were specifying. The ebXML community has
107 decided upon the semantic framework specified by the UN/CEFACT Modeling Methodology and
108 its Metamodel as this lingua franca.

109 The UMM "is targeted primarily at personnel knowledgeable in modeling methodology who
110 facilitate business process analysis sessions and provide modeling support." It also serves as a
111 checklist for standardized models when a previously specified business process is contributed to
112 UN/CEFACT for inclusion and incorporation as a standard business process model." [UMM]

113 People without the expertise in analysis and modeling will likely find that the UMM will be useful as
114 a reference manual. These people will use UMM compliant approaches or, even, alternative
115 methodologies during the analysis of business processes. Practical experience tells us that it will
116 be more useful to the electronic business community to have an approach that does not require
117 such analysis and modeling expertise. An approach that a businessperson can apply would be
118 most useful. The Business Process Analysis Worksheets and Guidelines provide such an
119 approach.

120 This document contains several worksheets that guide analysts towards UMM compliant
121 specifications of their common business processes. We have tried to provide tools for users
122 regardless of whether we're working on behalf of a standards body or an individual company.
123 Furthermore, we provide a variety of scenarios guiding how one might go about filling out these
124 worksheets (e.g. top-down vs. bottom up)

125 Different degrees of rigor are required within these worksheets. As we approach the lower level,
126 certain elements and organization of the specification are required to meet the requirements of the
127 ebXML technical framework. At higher levels there is a good deal of latitude about the way
128 concepts are grouped. In many cases, things such as assumptions and constraints will be
129 specified in natural language rather than in a formal one.

130 4.2 Audience

131 We do not expect the users of these worksheets to be experts in business modeling, however it is
132 expected that they are subject matter experts in their respective areas of practice. They should

133 have detailed knowledge of the inter-enterprise business processes they use to communicate with
134 their trading partners.

135 This document could also be used by industry experts to help express their sectors business
136 processes in a form that is amenable to the goals of the ebXML registry and repository.

137 Of course, software vendors that are supplying tools (modeling and otherwise) in support of the
138 ebXML framework will find useful information within.

162

163 4.4 Document Conventions

164 The keywords MUST, MUST NOT, REQUIRED, SHALL, SHALL NOT, SHOULD, SHOULD NOT,
165 RECOMMENDED, MAY, and OPTIONAL, when they appear in this document, are to be
166 interpreted as described in RFC 2119 [Bra97].

167 Heretofore, when the term *Metamodel* is used, it refers to the UMM e-Business Process
168 Metamodel as defined in [UMM].

169 5 Design Objectives

170 5.1 Goals/Objectives/Requirements/Problem Description

171 ebXML business processes are defined by the information specified in the ebXML UMM e-
172 Business Process Metamodel (hereafter referred to as the "Metamodel"). The Metamodel
173 specifies all the information that needs to be captured during the analysis of an electronic
174 commerce based business process within the ebXML framework. ebXML recommends the use of
175 the UN/CEFACT Modeling Methodology (UMM) in conjunction with the Metamodel. The UMM
176 provides the prescriptive process (methodology) to use when analyzing and defining a business
177 process.

178 The ebXML Business Process Worksheets are a set of business process design aids, to be used
179 with the UMM as a reference, to sufficiently reflect all necessary parts of a business process
180 towards the Metamodel; and thus be able to activate an ebXML business process relationship. It is
181 the Worksheet based approach that provides an easier way of applying the UMM and the UMM
182 Metamodel.

183 The intent of the worksheets (or a business process editor) is to capture all the bits of information
184 that are required to completely describe a business process so that it can be registered, classified,
185 discovered, reused and completely drive the software.

186 To develop company business processes for an ebXML compliant electronic trading relationship,
187 use the UMM as a reference guideline plus the ebXML Business Process Worksheet to create the
188 necessary business process models.

- 189 1. A business need or opportunity is identified and defined before using these procedures.
- 190 2. A Focus Project Team, usually representing a multifunctional set of experts from IT, business
191 process ownership and business process experts needed to work out the business process
192 using the ebXML Business Process Worksheet.
- 193 3. Using the ebXML Business Process Worksheets, the Focus Project Team will be able to
194 develop an ebXML Business Process Specification that can be reviewed and verified by the
195 business. In addition, all necessary information to populate the ebXML Metamodel will be
196 made available to enable an ebXML trading relationship.

Figure 5-1, Worksheets Architectural Context

198 5.2 The Analogy

199 The following analogy is useful in understanding the role of the Worksheets and other
 200 documentation and tools to the ebXML Business Process Collaboration Metamodel and the
 201 UN/CEFACT Modeling Methodology.

Item	United States Internal Revenue Service (IRS) Tax System
<i>ebXML Business Process Collaboration Metamodel</i> <i>UN/CEFACT Modeling Methodology.</i>	Entire tax code
Worksheets and Templates	IRS Forms
Methodology Guidelines	IRS Instruction Booklets
Business Process Editor Tool Suite Repository of Business Process Specifications, Core Components, etc.	Something like TurboTax and other software packages for preparing personal or business tax forms where these packages would have on-line access/search of all your tax and tax related records and the Tax code.

202

203 In order to actually specify a business process all we really need is the Worksheets and
 204 Templates⁴. However, in order to ensure that we fill in the forms properly we will need to have a set
 205 of instructions that augment the templates and provide some of the rationale behind the templates.

206 5.3 Caveats and Assumptions

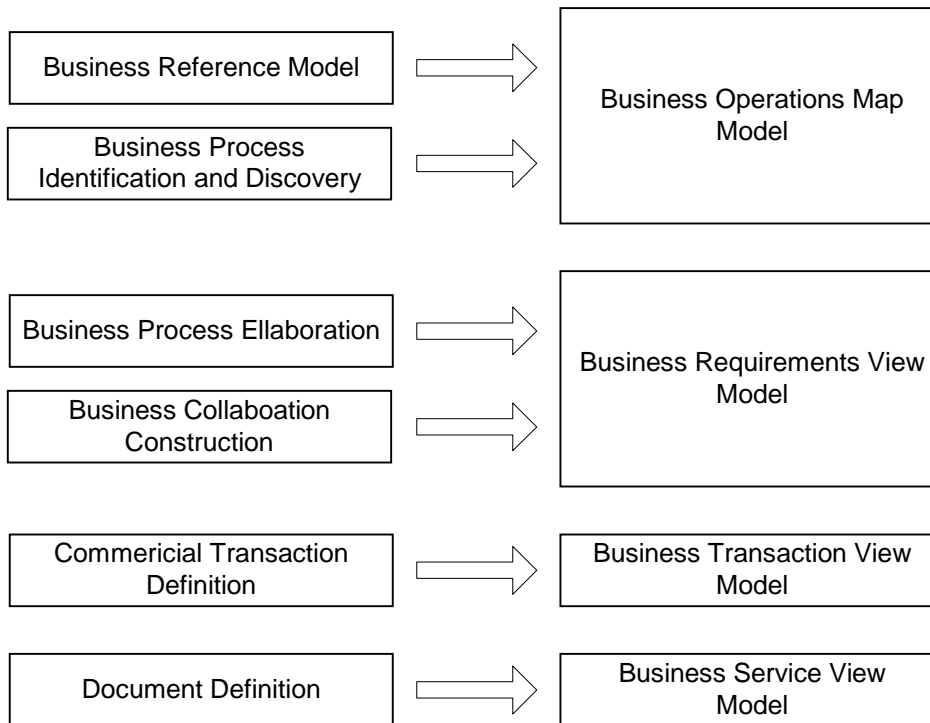

207 The worksheets in this document are targeted towards the UMM as specified in the Revision 8E
 208 document. Revision 9 has come out while this document was under development but there was
 209 not enough time before the delivery date of this document to align it with the changes present in
 210 Rev 9.

211 This document is *non-normative*; the documents identified above should be considered the
 212 authority on the definitions and specifications of the terminology used herein. This document is
 213 intended to be an application of those principals and technologies.

⁴ A template is a document of file having a preset format that is used as a starting point for developing human-readable versions of the buiness process specifications so that the format does not have to be recreated each time it is used.

214 6 Worksheet Based Analysis Overview

215 As stated above, the purpose of this document is to provide worksheets that guide the user
 216 through the construction of a UMM compliant specification of their business processes. The
 217 following diagram shows mapping from the worksheets to the high level components of the UMM.
 218 Note, the document definition worksheet is currently not included in the set of worksheets, please
 219 see the Core Components tools for this.

220

221

Figure 6-1 Overview of mapping from Worksheets to Metamodel

222 The expectation is that after the worksheets have been completed, there will be sufficient
 223 information to mechanically produce a Metamodel based specification of the modeled business
 224 process(es). The worksheets given above are:

225 **Business Reference Model** – Use this to define the “frame of reference” of the rest of the
 226 worksheets. This provides definitions of terms and, perhaps, canonical business processes (e.g.
 227 [SCOR]⁵)

228 **Business Process Identification and Discovery** – Use this to do an inventory of the business
 229 processes. This is really just a set of high-level use cases merely to identify the existence of
 230 processes and the stakeholders without going into detail.

231 **Business Process Elaboration** – These worksheets are used to flesh out the business
 232 processes. This identifies the actual actors as well as pre and post conditions for the business
 233 process.

⁵ Defines plan, source, make and deliver business areas in their Supply Chain Operations Reference (SCOR) model

234 **Business Collaboration Definition** – In these worksheets we define the economic events that
235 take place to fulfill the business process. This is where one defines the system boundaries and the
236 protocols that flow between them.

237 **Commercial Transaction Definition** – These worksheets are more technically oriented than the
238 others (which have a decidedly more “modeling” orientation). At this stage one defines the actual
239 activities and authorized parties within the organization that initiate these transactions.

240 **Business Information Definition** – In these worksheets one defines the contents of the
241 information field, widths, data types, descriptions, requirement traceability and, perhaps, the
242 additional *context*⁶ necessary to construct the document from the Core Components subsystem.

243 6.1 Basic Guidelines for filling out Worksheets

244 6.1.1 Focus on public Business Processes

245 While these worksheets could be used to model any kind of business process, the focus of the
246 ebXML effort is to make trading partner integration easier, cheaper, and more robust. Therefore the
247 expectation is that the primary focus will be on *public* faces of your business processes.

248 6.1.2 The REA Ontology

249 The UMM and ebXML groups are recommending the use of the Resource-Economic Event-Agent
250 Ontology for the formalization of business collaborations. The worksheets in the main body of this
251 document are intended to be more generic in nature however please refer to [BPAO] for further
252 information on this topic⁷ and associated worksheets.

253 6.1.3 Use the worksheets in the order that makes the most sense for you

254 For the purposes of this document we proceed from the top-level step (Business Reference Model)
255 down to the lowest-level step (Commercial Transaction). It is important to note, however, that these
256 worksheets can be filled out in whatever order makes the most sense from the user’s perspective.
257 For example, a person who is trying to retrofit an existing document based standard (e.g.
258 EDIFACT) might want to start by filling in the Commercial Transaction Definition worksheets
259 (perhaps only specifying trivial definitions for the higher level worksheets). A person looking to
260 formalize the definitions for an entire industry may very well start from the Business Reference
261 Model worksheet.

262 6.1.4 The worksheets can be used for projects of various scopes

263 Although the Metamodel has definite requirements on *what* objects need to be present to comprise
264 a complete specification, it says little about the scope of what those specifications represent. For
265 example, if you are only trying to model a specific interaction with one of your trading partners, you
266 do not need to include a complete *Business Reference Model* for your entire industry, just include
267 the parts that are directly relevant for the interaction you are modeling. Similarly, if you are just
268 doing a small set of interactions for your company, you might choose to have the *Business Area* or
269 *Process Area* just be your own company.

⁶ Please see [RCRCCBP].

⁷ Worksheets will be made available in a future version of this document.

270 6.1.5 Think how will people use what you construct

271 As you fill in these worksheets please keep in mind how the generated UMM specification will be
272 used by a user of the repository. The two principal uses envisioned are:

- 273 • To determine if a given collaboration is appropriate for reuse (or at least is a close enough
274 match for subsequent gap analysis)
- 275 • As an *on-line implementation guide*. A potential trading partner (or a 3rd party on their
276 behalf) could examine the public processes/collaborations you provide and construct an
277 integration plan.

278 This means trying to use industry wide terms (or at least Business Reference Model terminology)
279 to decrease the ambiguity or misunderstanding between you and the eventual consumers of these
280 specifications.

281 6.1.6 Re-use is one of the primary goals of ebXML

282 As stated above, the hope is that users will develop models that are reusable by others. Towards
283 that end, it is intended that the Worksheets be used in conjunction with a browser that lets the user
284 search business process libraries for items that have already been defined. The items (e.g.
285 business processes, business collaborations, document schemas, etc.) can be referenced (re-
286 used as is) or copied to the worksheets and changed as needed. Overtime, business process
287 catalogs will become populated with a sufficiently large number of business processes. When this
288 happens, the analysis processes will often be a simple matter of validating pre-defined business
289 processes against requirements.

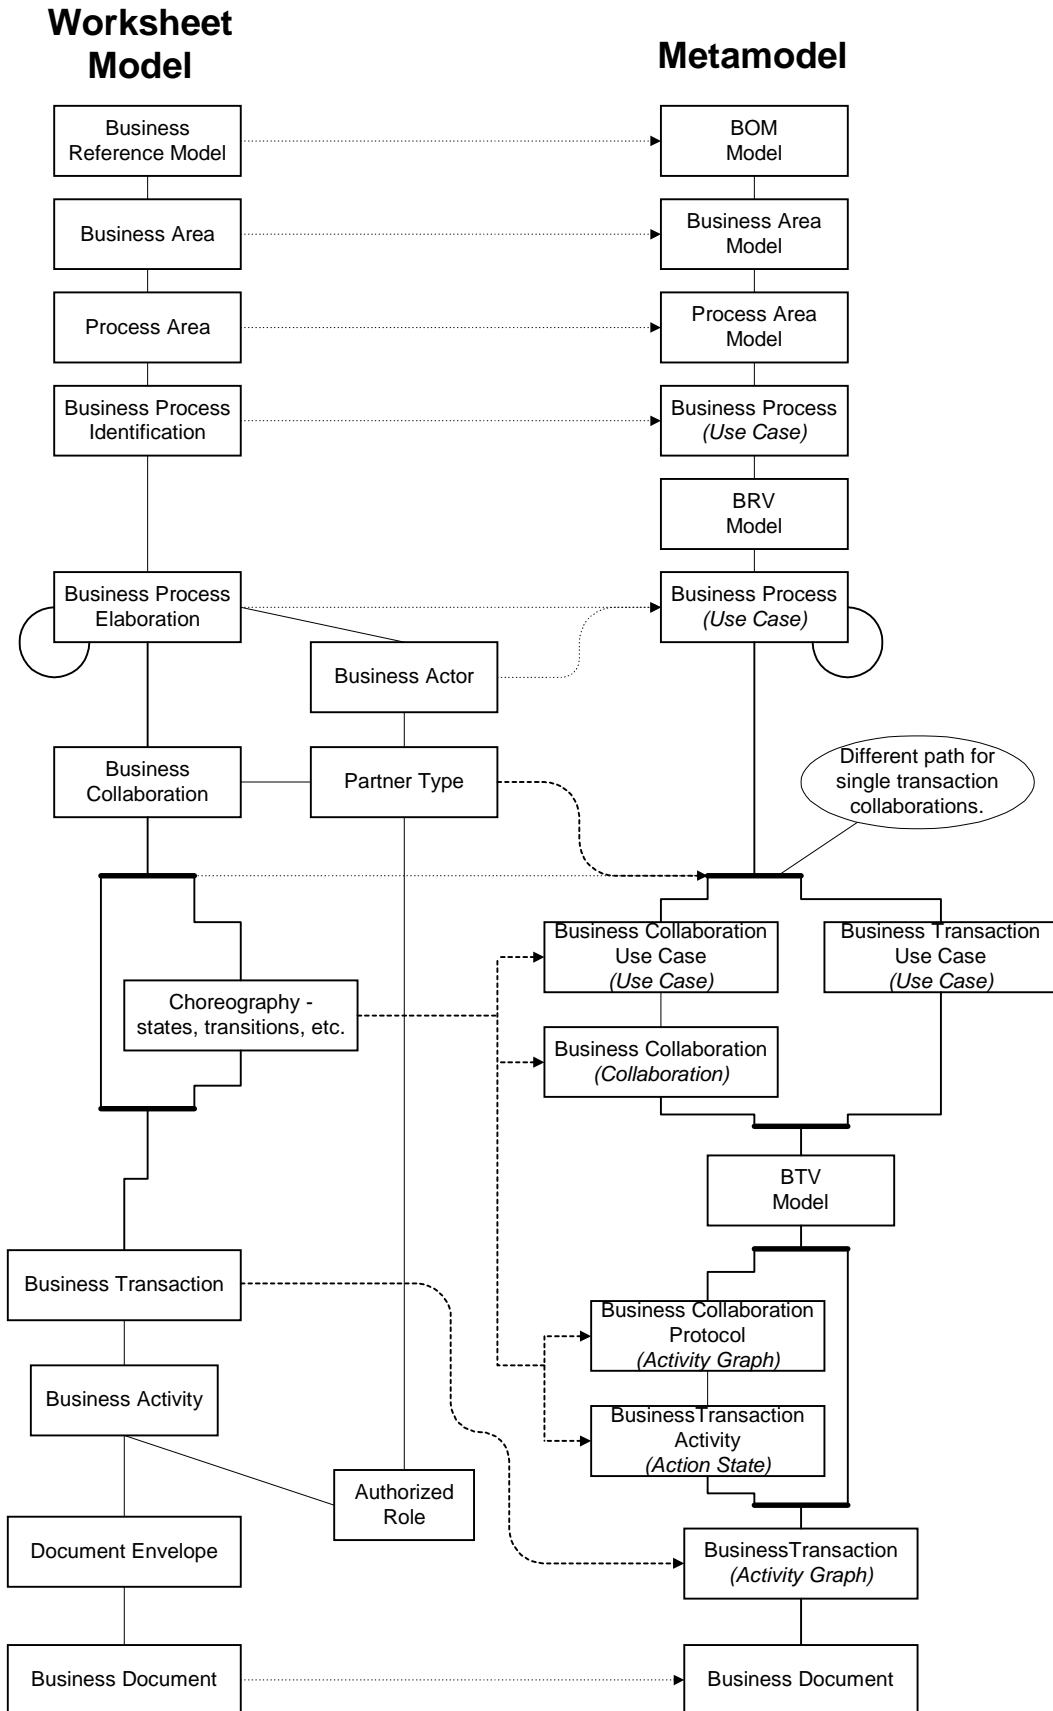

290 6.1.7 Note on optional fields in the worksheets

291 Some of the worksheets contain entries that are labeled as optional for ebXML. These are
292 attributes that appear in the UMM but are not required as part of the ebXML Specification Schema.
293 These are typically business objective/justification topics. While these are obviously very important
294 aspects of any modeling endeavor, ebXML is oriented towards *exposing* an organization's public
295 processes to their trading partners. Advertising that organizations justifications for such interfaces
296 could potentially publicize strategic information that said organization would prefer to keep private.⁹

297 6.2 Worksheets to Metamodel Mapping

298 The following diagram sketches out a more detailed mapping from the Worksheets Model to the
299 Metamodel defined by the UMM. The leftmost column is the selection of the main elements that
300 that the Worksheets need to specify or edit. The rightmost column are the Metamodel elements
301 that those worksheets map to, also showing intervening elements that the Worksheets need to
302 construct and manage in order to be able to save and retrieve the business process model
303 correctly (in terms of the Metamodel). The rightmost column also shows the base element for each
304 element. The middle column is the other elements that are part of the Worksheets. They are the
305 same as the Metamodel elements of the same name.

⁹ There has been discussion on private vs. public repositories where some or all aspects of the model are stored in a restricted access repository.

307

 308

7 Business Process Identification and Discovery

309

7.1 Goals

310 The first set of worksheets helps the user begin formalize the domain they are trying to model
 311 processes in. The first stage in the methodology is to identify the “top level” entities and organizing
 312 concepts in the domain.

313

314

Figure 7-1 Business Process Identification and Discovery Worksheet to Metamodel Mapping

315 At this stage we define terminology and identify the players as well as which business processes
 316 those players interact with. To quote the UMM, at this stage in the model the goal is to:

- 317 ■ To understand the structure and dynamics of the business domain,
- 318 ■ To ensure that all users, standards developers and software providers have a common
 319 understanding of the business domain,
- 320 ■ To understand the daily business in the business domain independent of any technical
 321 solution,
- 322 ■ To create categories to help partition the business domain that enables an iteration plan to
 323 complete the model,
- 324 ■ To structure the model in the form of a Business Operations Map (BOM),
- 325 ■ To capture the justification for the project,
- 326 ■ To identify the stakeholders concerned with the modeled domain, some who will be
 327 independent of the processes within the domain.

328 The modeling artifacts that correspond to the UMM are:

329 ■ Business Area [Package]

330 ■ Process Area [Package]

331 ■ Process(es) [Use Cases]

332 7.2 Guidelines

333 7.2.1 How does one decide how big to make the various groupings at this
334 level?

335 Referring back to the primary guidelines, think about what you are trying to communicate. If you
336 are more focused on identifying the public processes, then think about grouping them by partner
337 type or, perhaps by the area of your business these partners interact with. If you are trying to
338 formalize an entire business sector, determine the *archetypes* that are prevalent in that sector and
339 group them by business function area. These are just rules of thumb and this is still largely an “art”.
340 Keep in mind your potential audience and think what would make the most useful organization for
341 them.

342 The activity diagrams in this workflow will likely discover more refined business process use cases.
343 The Business Operations Map (BOM) Metamodel allows a business process to be represented by
344 more refined business processes. NOTE: At the point where the business process can not be
345 broken down into more child business processes, the parent business process can be called a
346 business collaboration use case as specified in the Requirements workflow.

347 7.2.2 What is the boundary of the business area?

348 According to the [UMM] the following guidelines are to be used in defining a business area:

- 349 • Stakeholders that are within the scope of the business domain and outside the scope of
350 the business domain but affect or are affected by inputs/outputs to/from processes within
351 the business domain. A stakeholder is defined as someone or something that is materially
352 affected by the outcome of the system but may or may not be an actor. For example one
353 who funds the business modeling project is a stakeholder. Actors are stakeholders that
354 are involved in the business process and are thus part of the business model.
- 355 • Information passing into or out of the business domain. Where possible, the domain
356 boundaries should be chosen so that a business transaction is logically initiated and
357 concluded within them.
- 358 • Key business entity classes. (i.e., things that are accessed, inspected, manipulated,
359 processed, exchanged, and so on, in the business process)

360 7.3 Worksheets¹⁰

361 7.3.1 Business Reference Model

362 Often times it is useful to define a “frame of reference” for the business processes being identified.
363 This frame of reference might define basic terms accepted by the given industry segment. For

¹⁰ Note that the examples given in the following worksheets more or less come from the hypothetical business process described in section 8.4 of [CCBP].

364 example the SCOR model defines a frame of reference for supply chain. VICS defines a frame of
 365 reference for trading partners in the retail industry. It also might be a more horizontal view such as
 366 the Porter Value Chain.

Form: Describe Business Reference Model	
Business Reference Model Name	[Provide a name for the reference model. You can use an existing reference model such as the Supply Chain Council or the Porter's Value Chain or create your own name.] <u>DOTCOM DROP SHIP RETAIL MODEL</u>
Industry Segment	[Provide the name of the industry segment that this business applies to. Search the business process library for a list of possible industry segments. If the industry segment does not exist, then provide an appropriate name/label for the industry segment.] <u>Retail.</u>
Domain Scope	[Provide a high level statement that encapsulates the scope of all the business areas.] <u>Online catalog, distribution center, delivery, billing.</u>
Business Areas	[List the business areas within the scope. A business area is a collection of process areas. A process area is a collection of business processes. You may wish to refer to the ebXML Catalog of Business Processes that provides a list of normative categories that may be used as business areas.] <u>Order Management, AR.</u>
<i>Optional for ebXML</i>	
Business Justification	[Provide the business justification for the collection of business processes] <u>Define more efficient on-line retailer/vendor interaction.</u>

367

368 7.3.2 Business Area

369 As mentioned in the guidelines section, there are no hard and fast rules for how to divide up the
 370 model into different business areas. One suggestion is to group business processes according to
 371 the primary business function. You might consider using the Porter Value Chain classification
 372 scheme (see Appendix B).

Form: Describe Business Area	
Business Area Name	[Provide a name for the business area. This should be listed in the Business Areas section of at least one Business Reference Model.] <u>Direct to Customer Retail</u>
Description	[A brief summary of this functional area.]
Scope	[Provide a high level statement that encapsulates the scope of all the business areas. The scope of the business area must be within the scope of the encompassing business reference model. Typically the scope of the business area will be more constrained or limited than the scope of the business reference model.] <u>Online catalog, order placement, distribution center, delivery, billing.</u>
Boundary of the Business Area	[Describe the boundary of the business area. This defines the entities that interact in this business area; actors, organizations, possibly systems] <u>Customer, Retailer, DSVendor, Carrier, Credit Authority.</u>
References	[Any external supporting documentation.] <u>VICS, SCOR</u>
Constraints	[Identify any constraints on the process areas (and, thus, business processes) within this business area.] 1. <u>Completely automated system.</u> 2. <u>Web browser limitations.</u> 3. <u>Domestic orders only</u>
Stakeholders	[Identify the practitioners that care about the definition of this business area. At this level, this is likely to be some participants in an industry group (perhaps a standards body or an enterprise). These are the people who will define the BRV.] <u>Customer, Retailer, DSVendor, Carrier, Credit Authority.</u>
Process Areas	[List the process areas within the scope. A process area is a collection of business processes. You may wish to refer to the ebXML Catalog of Business Processes that provides a list of normative process groups that may be used as process areas.] <u>Customer Commitment, Order fulfillment, Billing, Inventory Management.</u>
Optional for ebXML	
Objective	[Describe the objective of this business area.] <u>To deliver a product to a customer in a timely efficient manner.</u>
Business Opportunity	[Describe the business opportunity addressed by this business area.]

373

374 7.3.3 Process Area

375 Typically a business reference model would define a canonical set of process areas (see the
 376 Porter or SCOR reference models for examples). A process area consists of a sequence of
 377 processes that are combined to form the “value chain” of the given business area.

378

Form: Describe Process Area	
Process Area Name	[Provide a name for the process area. This should be listed in the Process Areas section of at least one Business Area.] <u>Order Fulfillment</u>
Objective	[Describe the objective of this process area.] <u>To deliver the goods ordered to the customer.</u>
Scope	[Provide a high level statement that encapsulates the scope of all the business areas. The scope of the business area must be within the scope of the encompassing business reference model. Typically the scope of the process area will be more constrained or limited than the scope of the corresponding business area.] <u>To fulfill customer's order using the third party supplier for a drop ship delivery.</u>
References	[External supporting documentation.]
Boundary of the Process Area	[Describe the boundary of the process area. The communicating services.] <u>Retailer and third party vendor.</u> [Issue: How is this different than Scope?]
Constraints	[Identify any constraints on the business processes within this process area.] <u>Inventory availability. On time delivery. System constrain.</u>
Stakeholders	[Identify the practitioners involved in this process area. <i>Question: is this a subset of those listed in the Business Area?.</i>] <u>Retailer, Third party vendor</u>
Business Processes	[List the business processes within the scope of this process area. You may wish to refer to the ebXML Catalog of Business Processes that provides a normative list of business processes.] <u>Manage Purchase Order.</u>
Optional for ebXML	
Business Opportunity	[Describe the business opportunity addressed by this process area.]

379

380 7.3.4 Identify Business Processes

381 For each business process in the process area fill in the following worksheet. A suggested rule of
 382 thumb for the appropriate granularity for a business process is that it is the smallest exchange of

383 signals between stakeholders that has an identifiable economic value (cref. [REA]).*Note that this is*
 384 *not always appropriate since “negotiation” could be a valid business process but it doesn’t really*
 385 *result in an economic consequence.*

386 Be sure to validate the information in the process area against the encompassing business area.
 387 For example, validate that the scope of the process area is within the scope of its business area.

Form: Identify Business Process	
Business Process Name	[Provide a name for the business process. You may wish to refer to the ebXML Catalog of Business Processes [CCBP] that provides a suggested set of commonly used business processes.] <u>Manage Purchase Order</u>
Process Area	[A process area is a group of business processes. Complete a Process Area form.] <u>Order Fulfillment</u>
Business Area	[A business area group together related process areas. Create a Business Area form.] <u>Direct to Customer Retail</u>

388

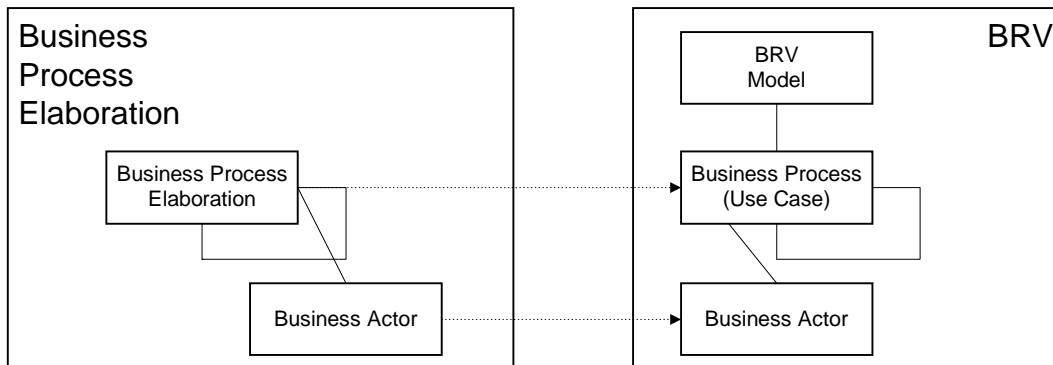

8 Business Process Elaboration

389

8.1 Goals

390

391 At this stage we begin to move from requirements analysis to design analysis. Consider the
 392 following diagram:

393

394 A business process is a use case that is used to gather requirements about business processes.
 395 Inputs to the business process must be specified in the preconditions and outputs from the
 396 business process must be specified in the post-conditions.

8.2 Worksheet

397

398 One of these is filled out for each business process. Keep in mind that a business process could be
 399 nested. You should use whatever organization makes sense for your purposes (though you might
 400 want to think in terms of reuse when considering possible decompositions).

Form: Business Process Use Case	
Business Process Name	[Provide a name for the business process. This should be a name identified on the form "Identify Business Process" and on a "Describe Process Area" form. If you are starting with this form, you may wish to refer to the ebXML Catalog of Business Processes that provides a normative list of business processes.] <u>Manage Purchase Order.</u>
Identifier	[This is a unique identifier that follows the Business Process Identifier Naming Scheme. This can be provided when the business process description is submitted to a business process library. See Appendix A for a more detailed discussion.] <u>bpid:ean.1234567890128:ManagePurchaseOrder\$1.0</u>
Actors	[List the actors involved in the use case.] <u>Retailer, Vendor</u>
Performance Goals	[A specification of the metrics relevant to the use case and a definition of their goals. Non-functional requirements may be a source of performance goals. For each performance goal, provide a name of the performance goal and a brief description of the performance goal.]
Preconditions	[Preconditions are constraints that must be satisfied starting the use case.] <u>1. Valid Sales Order 2. Valid Vendor Relation</u>
Begins When	[Describe the initial event from the actor that starts a use case.] <u>Sales Order Validation (expressed as events)</u>
Definition	[A set of simple sentences that state the actions performed as part of the use case. Include references to use cases at extension points.] <u>A valid Purchase Order placed by retailer with the vendor and a PO Ack is received from the vendor.</u>
Ends When	[Describe the condition or event that causes normal completion of the use case.] <u>PO Acknowledged returned to retailer.</u>
Exceptions	[List all exception conditions that will cause the use case to terminate before its normal completion.] <u>1. PO Rejected (Failure state of a process) 2. Late PO acknowledged</u>
Postconditions	[Post-conditions are constraints that must be satisfied ending the use case.] <u>1. Valid PO 2. Allocated Product</u>
Traceability	[These are the requirements covered (as shown in Annex 4, Use Case Specification Template, in the UMM).] <u>"PRD-FOO-6.5.4" (meaning Product Requirements Document for FOO project/solution, requirement 6.5.4).</u>

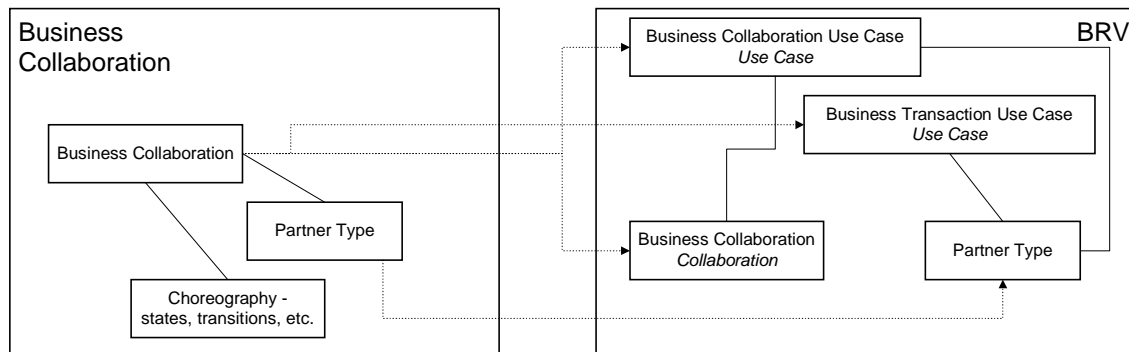

Business Collaboration and Economic Events

401

8.3 Goals

402

403 These worksheets develop the Business Requirements View (BRV) of a process model.

404

405 Figure 0-1 Mapping from Business Collaboration to BRV

406 The following items are specified:

- 407 • The business collaboration protocols that tie economic events together
- 408 • The system boundaries between which the protocols flow
- 409 • The input and output triggers of these collaborations
- 410 • The roles and constraints associated with the collaboration

411 The purpose of the Partner Collaboration and Economic Agreements Worksheets is:

412 From the [UMM, 3.1]:

413 ... to capture the detailed user requirements, specified by the stakeholders, for the business-to-
 414 business project. ... This workflow develops the Business Requirements View (BRV) of a process
 415 model that specifies the use case scenarios, input and output triggers, constraints and system
 416 boundaries for business transactions (BTs), business collaboration protocols (BCPs) and their
 417 interrelationships.

418 The modeling artifacts to be identified are:

- 419 ■ Business Transactions [Use Case]
- 420 ■ Business Collaboration [Use Case]
- 421 ■ Business Collaboration Use Case [Use Case Realization, Activity Diagram]

422 ▪ Economic Modeling Elements [Business Entities]

423 8.4 Worksheets

424 Detail the information in the table below for each business collaboration. Note that it may make
425 sense to use UML diagrams to convey some of this information.

Form: Business Collaboration	
Partner Types	[This is a list of entities that participate in the collaboration. These participants exchange the events that form the collaboration.]
Authorized Roles	[These are the roles that a partner must be authorized to play to issue specific transitions in the collaboration (by sending certain signals).]
Legal steps/requirements	[If any step in the collaboration has any legal standing, it should be captured here.]
Economic consequences¹¹	[If any step in the collaboration has an economic consequence, it should be captured here.]
Initial/terminal events	[List the events that initiate this collaboration and how it terminates.]
Scope	[Specify the set of business actions this collaboration encapsulates.]
Boundary	[Specify the systems and users that communicate with each other over the course of this collaboration.]
Constraints	[Spell out any special constraints that are relevant to this collaboration (e.g. business scenario, pre-conditions.)]

426

¹¹ Worksheets that address REA to greater detail and help users through the process of developing REA oriented collaborations will be developed in the future.

427 9 Business Transactions and Authorized Roles

428 9.1 Goals

429 The goal of this worksheet is to identify the individual transactions that implement the workflow of a
 430 Business Collaboration. A transaction is made up of several *activities* and each activity has an
 431 *authorized role* that the signaler must have in order to initiate that activity.

432 The modeling artifacts generated as a result of this worksheet is the BusinessTransaction Activity
 433 Diagram. Fill out one worksheet for each transaction in the collaborations

434 9.2 Guidelines

435 The UMM has defined several transaction patterns. It may be useful for you to identify your
 436 transactions with one of those (if for no other reason to make it clear to others the basic interaction
 437 pattern you intend to follow)

438 9.3 Worksheets

Form: Business Transaction	
Pattern	[If you have chosen to follow one of the canonical transaction patterns in the UMM ¹² (or elsewhere) denote it here.]
Agents and Services	[This is a list of agents and services that initiate activities.]
Business Activities and Associated Authorized Roles	[List each activity (along with it's initiator) and the role required to perform that activity]
Constraints	[Any constraints should be listed here.]

439

440 10 Business Information Description

441 10.1 Goals

442 The goal of this set of worksheets is to identify the information requirements for the business
 443 documents specified in the business transactions.

444 10.2 Worksheets

445 The first step in specifying business documents in a business process and information model, is to
 446 attempt to reuse business information objects in a Business Library. If an existing business
 447 document cannot be found then, domain components from Domain Libraries and core components
 448 from the Core Library can be used. Until the Business Library is built up, or imported from a
 449 creditable source, core components are likely to be referred to frequently, to first add to the

¹² See chapter 4 in [UMM].

450 repertoire of business information objects in the Business Library, and second, to create business
451 documents.

452 The steps for completing these worksheets are as follows:

- 453 1. See what attributes are available in business information objects in the available Business Libraries
454 that can be used in a business document.
- 455 2. If business information objects with appropriate attributes as required for business documents are
456 not available, new business information objects must be created.
- 457 3. Look for re-usable information components in the business library and the Core Library as
458 candidates for business information object attributes. Take context into account, as specified in the
459 business process and information models. Extend existing business information objects, domain
460 components, and core components as required.
- 461 4. Add the new attributes to existing business information objects, or introduce new business
462 information objects through a registration process that manages changes to the Business Library.
- 463 5. Use the new attributes, now in the Business Library, as needed in creating the business
464 documents.

465 10.2.1 Document Content Description

466 Describe each element or group of elements in the document. Logically related elements can be placed in separate
 467 forms (For example, a document may have logically three parts, a header, body, and summary. The body may have
 468 further logical partitioning.). Possible values for Occurs include: 1 (one instance), 0..1 (zero on one instance), 0..*
 469 (zero or more instances), 1..* (one or more instances), or n..m (n to m instances where n is less than m). Possible
 470 values for Data Type include primitive data types such as integer, string, date-type. If you happen to know the name
 471 of a reusable component from an domain library or the Catalog of Core Components, then you MAY reference it. The
 472 Semantic Description SHALL be stated in business terms and SHALL be unambiguous.

Form: Content Description					
Form Id:	[A name for the form. For example, "Invoice" or "Order Header"]				
Element/Component Name	Occurs	Data Type	Field Width	Semantic Description	Notes
[Provide a name for the element/component. For example, "Order Summary" or "Issued Date."]					

473

474 10.2.2 Content Mapping

475 These forms SHOULD be completed. This information is very important as it shows that the documents have a basis
 476 in existing standards. Furthermore, the information will be used to create document transformations. Standards to
 477 map to include EDIFACT, X12, xCBL, RosettaNet, and other standards such as OBI. Use XPATH and XSLT
 478 notation for referencing XML elements and describing the mappings. If a new document schema is created to fulfil
 479 the content requirements specified in the Document Content Description forms, then a set of Content Mapping forms
 480 should be completed for that schema (the component names in the forms are simply requirements for information)

481 For each Content Description form, complete a Document Content Mapping form for each standard to be cross-
 482 referenced.

Form: Content Mapping		
Form Id:	[A name of the corresponding Content Description the form. For example, "Invoice" or "Order Header"]	
Standard	[Name of the standard. For example, UN/EDIFACT]	
Version	[Standard version number. For example, D.01A]	
Element/Component Name	Mapping/Transformation	Note

483

484

12 Appendix A Business Process Identifiers

487 Objects of the entire ebXML business arrangement embodied by the UMM can be identified by a Business Identifier Naming Scheme, directly
488 related to the layers of the UMM. Specifically the Business Operations Map (BOM) with a Business Process Identifier naming Scheme
489 (BPINS), the Business Requirements View with a Business Collaboration Identifier Scheme (BCINS) and the Business Transaction View with
490 a Business Transaction Identifier Scheme (BTINS).

491

492 A BPINS naming scheme format is defined by :

493 bpid:<agency>:<agency-id>:<business-process-name>\$<major-version-number>.<minor-version-number>

494

495 A BCINS naming scheme format is defined by :

496 bcid:<agency>:<agency-id>:<business-collaboration-name>\$<major-version-number>.<minor-version-number>

497

498 A BTINS naming scheme format is defined by :

499 btid:<agency>:<agency-id>:<business-transaction-name>\$<major-version-number>.<minor-version-number>

500

501 Where

502

- 503 • *bpid* is the fixed string “bpid” indicating the entire identifier is a business process identifier.
- 504 • *bcid* is the fixed string “bcid” indicating that the entire identifier is a business collaboration identifier.
- 505 • *btid* is the fixed string “btid” indicating that the entire identifier is a business transaction identifier.
- 506 • *agency* identifier or name of the agency that owns the agency-ids **and must be a globally unique identifier**. For
507 example, DUNS and EAN.
- 508 • *agency-id* identifier of the organization that owns the business process **and must be a globally unique identifier**. *No
509 other entity SHALL use the agency identification of another entity.*
- 510 • Major and minor version numbers are each integers and need to respect any specific Registry Authority conventions
511 defined.

512 The business-process-name, business-collaboration-name, business-transaction-name should be descriptive names. It is recommended that
513 the descriptive name be in camel-case. The names must not contain spaces, periods, colons, or dollar signs. The organization or agency-id
514 that owns the business transaction SHALL be responsible for guaranteeing that the identifier is unique..

515

516 Valid examples of business processes using the identifier naming scheme include :

517 btid:ean.1234567890128:DistributeOrderStatus\$1.0

 bpid:icann.my.com:NewBusinessProcess\$2.0

518

519 With respect to the ebXML Registry Information Model specification¹³ the definition is as follows:

520 **BPINS**

Registry Information Model

521	bpid	ExtrinsicObject.objectType
522	bcid	ExtrinsicObject.objectType
523	btid	ExtrinsicObject.objectType
524	agency	Organization.name
525	agencyid	Organization.uuid
526	business-process-name	ExtrinsicObject.name
527	business-collaboration-name	ExtrinsicObject.name
528	business-transaction-name	ExtrinsicObject.name
529	major-version-number	ExtrinsicObject.majorVersion
530	minor-version-number	ExtrinsicObject.minorVersion

531
532 An ExtrinsicObject is a special type of ManagedObject (one that goes through a defined life cycle); the extrinsic object is not required for the
533 core operation of a registry. An Organization is defined as an IntrinsicObject; it is core to the function of a registry.

534

535

536

541

¹³ Cref [REG1] and [REG2].

542 Appendix B The Porter Value Chain

543 The following table shows the categories of the Porter Value Chain and how they map to REA concepts. This is included as an aid to help users formalize
 544 their classification of the elements of a business process specification.

Normative Category	Normative Sub-Category	Resource inflows & outflow	Major types of events	Economic Agents & Roles
Procurement	Bid Submission Contract Negotiation Purchase Order Preparation Receiving	Money Raw materials Facilities Services Technology	Payments Purchase Purchase Orders Price Quotes Contract Negotiation	Buyer Seller Vendor Cashier
Human Resources	Hiring Training Payroll Management Personnel Deployment	Money Purchased training materials Purchased benefit packages	Cash Payments Acquisition of labor Training	Employee Student Beneficiary
Transportation	Loading Shipping Packaging	Raw Materials Delivered Raw Materials Manufactured Goods Delivered Manufact. Goods	Shipment Warehousing Tasks Material Handling Trucking	Buyer Vendor Logistics Worker Trucker
Manufacturing	Product Development Product Design Assembly Quality control	Facilities & Technology Labor Raw Materials Finished Goods	Manufacturing Operation Raw Material Issue Manufacturing	Factory Worker Supervisor QC Inspector

Marketing & Sales	Advertising Use & Campaigning Marketing Management Sales Calling Customer Credit Managemnt	Labor Advertising Service Delivered Goods Product Services Cash	ng Job Cash Payment Customer Invoice Sale Order Price Quotes Contract Negotiation	Customer Salesperson Cashier
Customer Service	After Sales Service Warranty Construction	Labor Purchased Services Product Warranties and Services	Service Call Product Repair Service Contract	Customer Service Agent Customer
Financing	Loan Management Stock Subscriptions and Sales Dividend Policy	Cash Bonds Stocks Derivative Instruments	Interest Payments Stock Subscriptions Dividend Declarations Cash Receipts	Stockholders Bondholders Investment Brokers Financial Managers
Administration	Accounting Financial Reporting Executive Management	Employee Labor	Employee Service Management Projects	Managers Clerks
